## 2. STL

### 2.1. Algorithm

Funciones que modifican rangos

Función	Params	Ejemplo
copy	first last result	B.resize(A.size()); copy(all(A), B)
fill	first last val	memo.resize(MAXN); fill(all(memo), -1)
rotate	first middle last	rotate(begin(A), begin(A) + 3, end(A));

Búsqueda binaria en vector ordenado

```
templT int primer_igual (vector<T>& arr, T x) {
    auto it = lower_bound(all(arr), x);
    if (it == arr.end() || *it != x) return -1;
    return it - arr.begin();
}
```

```
templT int ultimo_igual (vector<T>& arr, T x) {
    if (arr.begin() == arr.end()) return -1;
    auto it = prev(upper_bound(all(arr), x));
    if (*it != x) return -1;
    return it - arr.begin();
}
```

```
templT int ultimo_menor (vector<T>& arr, T x) {
    if (arr.begin() == arr.end()) return -1;
    auto it = prev(lower_bound(all(arr), x));
    if (*it >=) return -1;
    return it - arr.begin();
}
```

```
templT int primer_mayor (vector<T>& arr, T x) {
    auto it = upper_bound(all(arr), x);
    if (it == arr.end()) return -1;
    return it - arr.begin();
}
```

Compresion de coordenadas

```
using ll = long long;

vector<ll> compress (vector<ll>& A) {
    int N = A.size();
```

```
    vector<ll> D = A;
    sort(all(D));
    D.resize(unique(all(D)) - D.begin());
    forn(i, N) A[i] = lower_bound(all(D), A[i]) - D.begin();
    return D;
}
```

Operaciones de conjuntos con vectores ordenados (lineal)

// Siempre hacer resize al final asi:

```
vector<int> A = { 5, 10, 15, 20, 25};
vector<int> B = {10, 20, 30, 40, 50};
```

```
vector<int> U(A.size() + B.size());
```

```
auto it = set_union(all(A), all(B), begin(U));
```

```
U.resize(it - U.begin());
```

Función	Descripción
set_union	Unión
set_intersection	Intersección
set_difference	Elementos que están en el primero y no en el segundo
set_symmetric_difference	Elementos que están en uno pero no los dos (como el xor)

### 2.2. Set y Map

## 8. Brainstorming

- Graficar como puntos/grafos
- Pensarlo al revez
- ¿Que propiedades debe cumplir una solución?
- Si existe una solución, ¿existe otra más simple?
- ¿Hay elecciones independientes?
- ¿El proceso es parecido a un algoritmo conocido?
- Si se busca calcular  $f(x)$  para todo  $x$ , calcular cuánto contribuye  $x$  a  $f(y)$  para los otros  $y$
- Definiciones e identidades: ¿*que significa* que un array sea palindromo? (ejemplo)
